

PETROLEUM CLEANUP

HSW has successfully remediated numerous petroleum-impacted facilities. The HSW staff is well trained and experienced to efficiently guide projects through completion, while maintaining compliance with cleanup directives from regulatory agencies.

Our expertise allows us to excel at performing these activities under the most challenging conditions typically found at operating retail convenience stores, as well as active bulk storage facilities. It is our goal to work with clients to develop a cleanup strategy that allows the cleanup work to proceed with minimal interruption to the daily business of active retail and non-retail facilities.

HSW can also assist property owners by providing:

- A current snap-shot of a facility's status with respect to petroleum cleanup;
- Assistance in understanding State funding Caps and Deductibles (if applicable);
- Identification of potential 3rd party liability as a result of recent Notifications made by the regulatory agencies, and;
- A review of site conditions to determine whether funding can be available for contaminated media removal discovered during UST system upgrades and closures.

HSW is able to provide these services through our staff of licensed professional engineers and geologists with over 25 years of experience with petroleum cleanup, compliance, and monitoring.

INNOVATIVE TECHNOLOGIES

HSW has earned a reputation as a firm that employs innovative technologies to streamline remediation programs. Cost saving techniques for remediation include:

- Risk assessments to develop alternate site rehabilitation levels (SRLs);
- Natural Attenuation Monitoring (NAM);
- In-situ air sparging (AS) and soil vapor extraction (SVE);
- Soil Flushing, and;
- Enhanced anerobic bioremediation (EAB).
